

EnergyFlex

A flexible approach to local energy modelling

Research Talk | 5th July 2022

DAFNI Conference 2022

André Neto-Bradley

Energy Research Team, BEIS

Today's Talk

- Background to the Project
- Overview of the EnergyFlex Model
- Use Case: Studying Spatial Trends
- Use Case: Retrofit Analysis

Who we are?

Ruchi Choudhary

André Neto-Bradley

Department of Engineering

*Expertise in Energy modelling,
Uncertainty in Decision-making, and
socio-economics of energy use*

Nick Malleson

Patricia Ternes

School of Geography

*Expertise in Spatial Modelling, Agent
Based Modelling and Synthetic
Populations*

Brian Matthew

Tom Gowland

Motivation

Decarbonising Residential Energy Use

- Decarbonising residential energy demand requires identifying opportunities at a household scale.
- Data at a household scale is often not available, or offers limited information.
- EnergyFlex offers a **microsimulation-based solution** to this.
- We aren't just looking for flexibility in demand but also to support flexible and locally tailored approaches to decarbonisation.

**~10% of CO₂
emissions in
UK come from
residential
heating alone**

Motivation

Leveraging Public Data to Model Occupancy

- In energy modelling and building simulation we often rely on one of two things to model occupant behaviour:
 - Assumptions, or...
 - Case study datasets (specialised & usually restricted)
- Both of these have issues.
- Can a microsimulation approach offer a third way on this?

EnergyFlex: An overview

1

Public data is used to create representative synthetic households for a local area.

2

National trends in housing energy efficiency and demand are modelled

3

Policies and solutions can be tested on a household by household basis

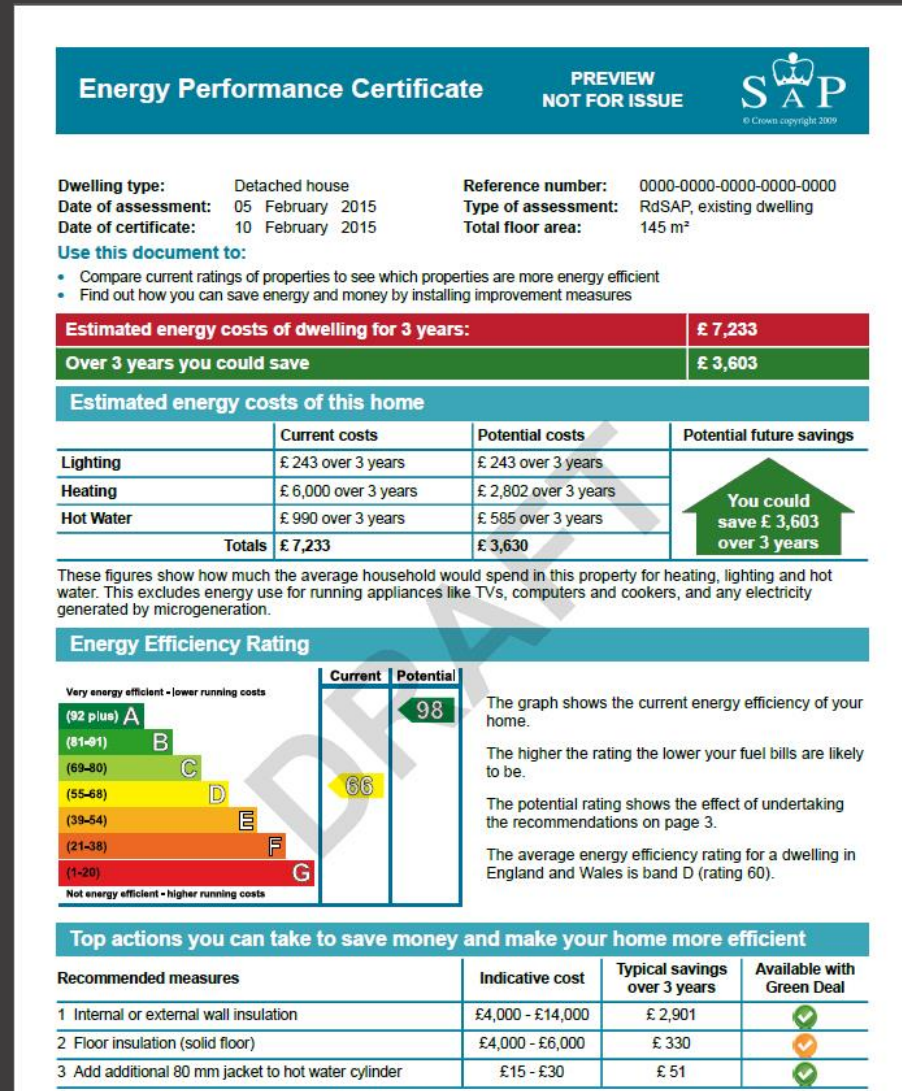

Side note: What about the EPCs?

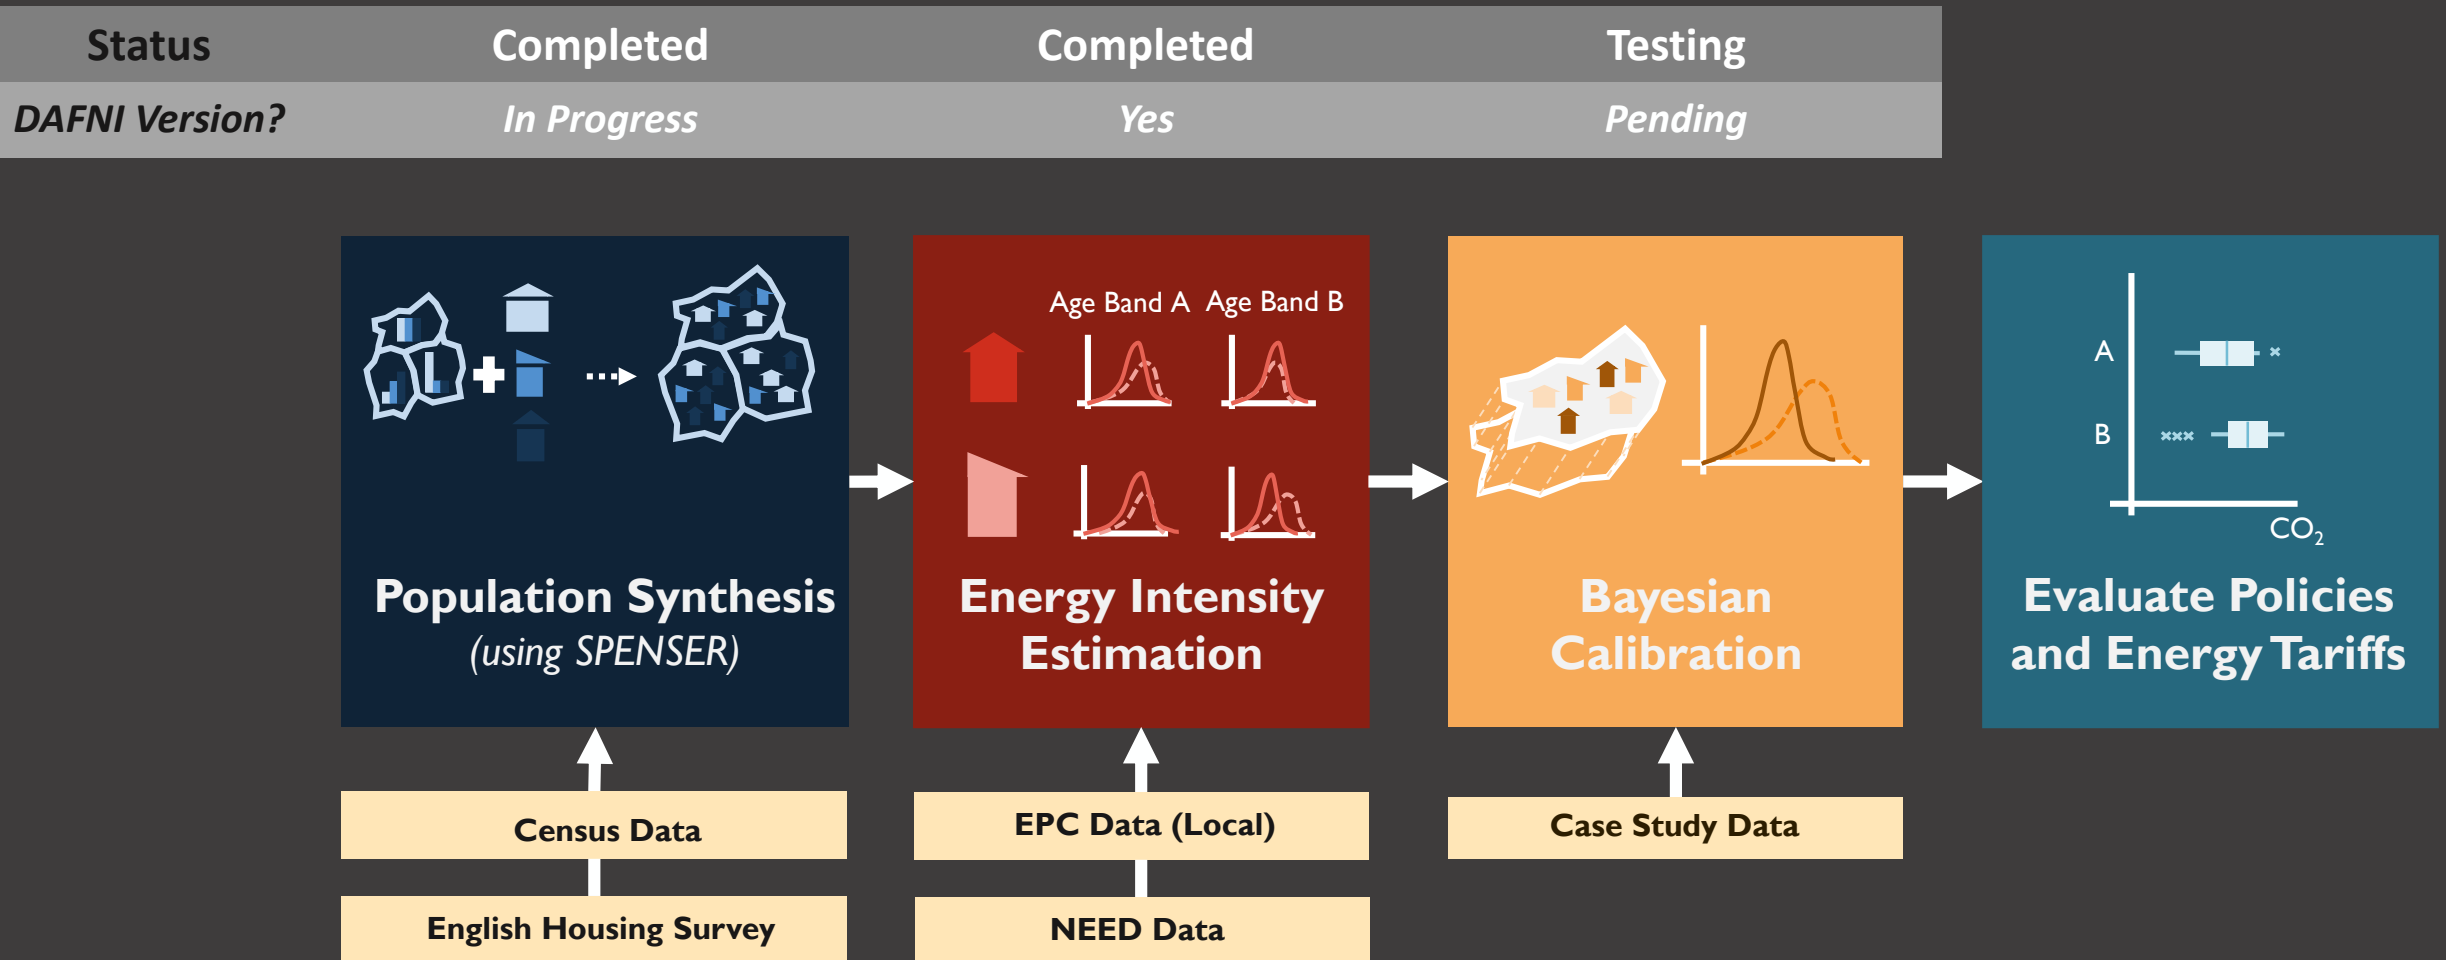

EPCs are Energy Performance Certificates and they are public records detailing the energy efficiency rating of a property.

While useful, EPCs are not a replacement for a microsimulation approach such as EnergyFlex because:

- 1) The EPCs are a biased record. They only include homes sold or rented since 2008.
- 2) EPCs often contain mistakes, approximations or inconsistencies in non-headline values.
- 3) There is no information on socio-economic context.
- 4) This data is not anonymous, which raises research ethics questions.

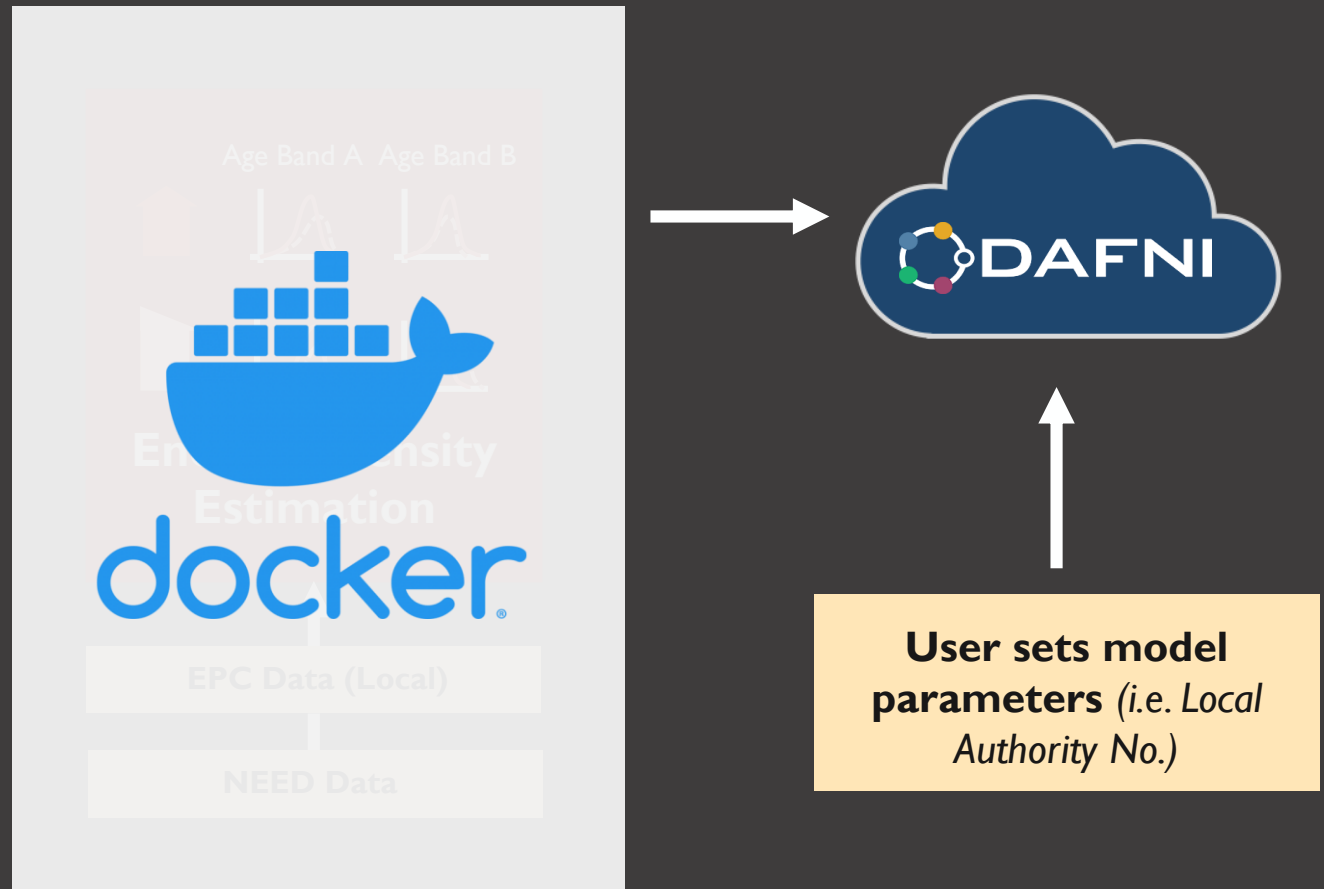

EnergyFlex: Model Structure

EnergyFlex: Using DAFNI

- Sharing models is challenging and can limit opportunities to pursue meaningful stakeholder engagement.
- DAFNI allows us to package up the model and upload it so anyone can run them in the cloud.
- This has enabled us to more easily respond to engagement from varied stakeholders including housing associations and government.

Exploring Spatial Inequalities

The model can be used to explore spatial trends in energy efficiency of homes.

We have found that **energy efficiency** of new builds correlates with **house prices** in the area and **incomes**, and has a distinct spatial distribution across the country

Energy Intensity
across houses
of given type
and age
(kWh/m²/year)

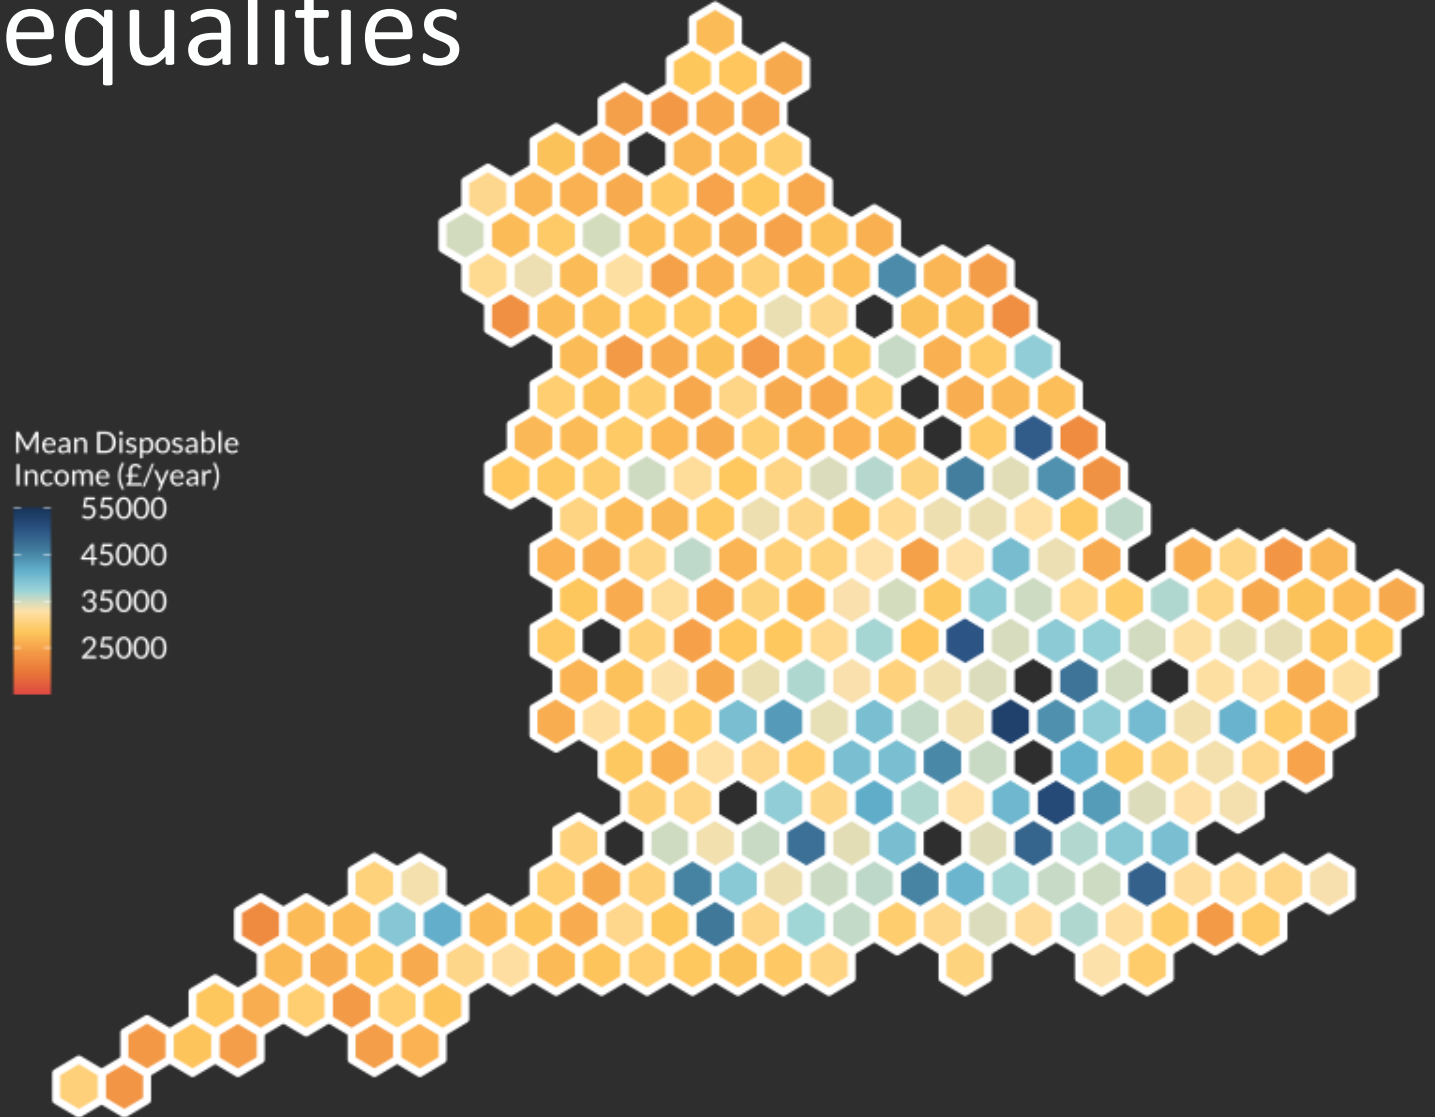

We wrote an article for *The Conversation* about how these regional differences could compound existing socio-economic inequalities.

Exploring Spatial Inequalities

The model can be used to explore spatial trends in energy efficiency of homes.

We have found that **energy efficiency** of new builds correlates with **house prices** in the area and **incomes**, and has a distinct spatial distribution across the country

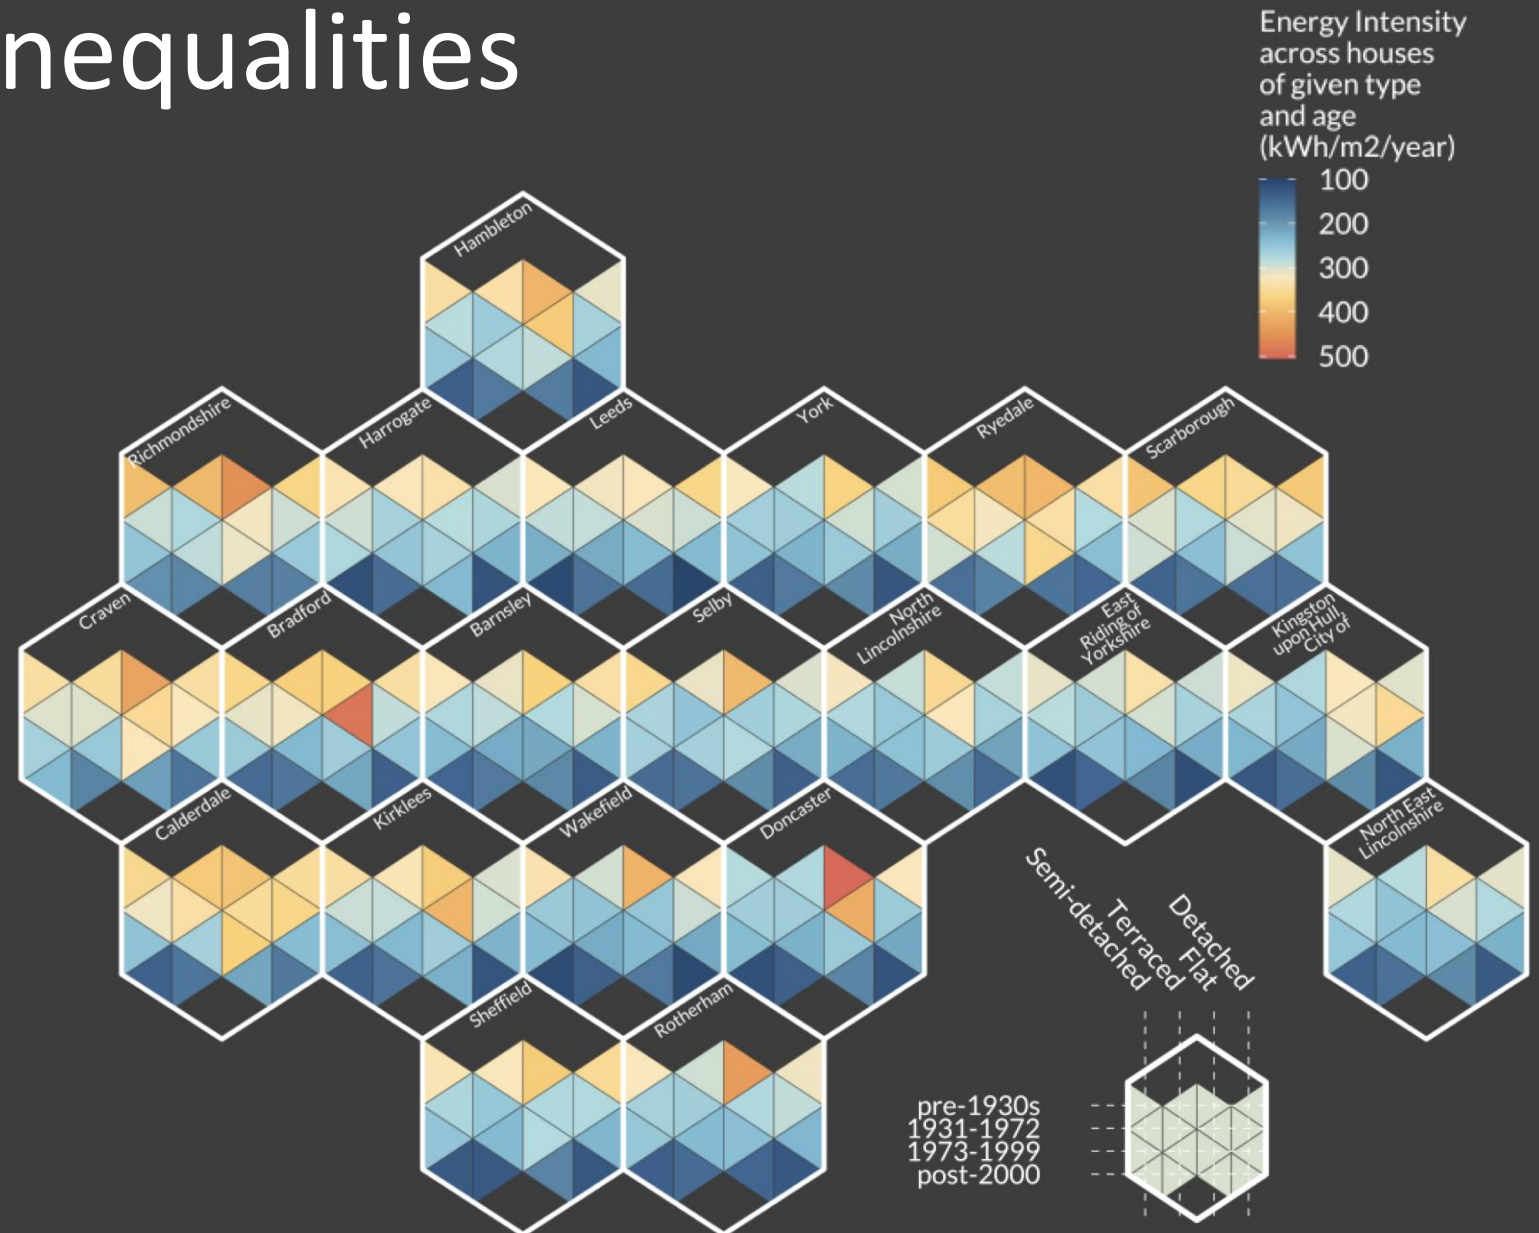

We wrote an article for *The Conversation* about how these regional differences could compound existing socio-economic inequalities.

Exploring Spatial Inequalities

We can also compare trends across different ages and types of housing in a region.

For example older terraced housing and flats in larger cities and affluent areas tend to be more energy efficient than elsewhere, suggesting higher levels of retrofits.

Simulating Retrofit Solutions [DEMO]

Simulating Retrofit Solutions [DEMO]

Local Authority: Haringey, London

Housing Stock by
building type
and *age*

Simulating Retrofit Solutions [DEMO]

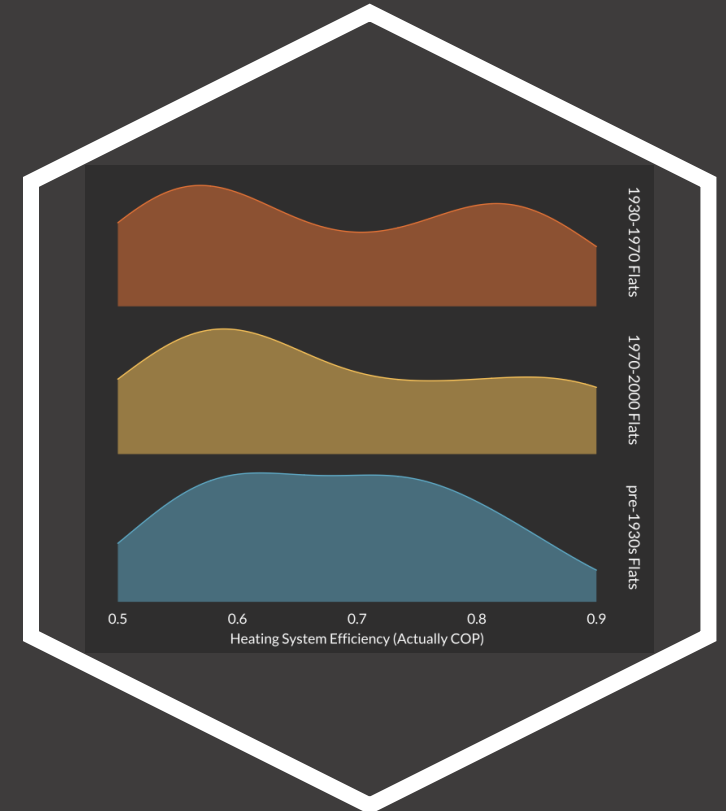

Local Authority: Haringey, London

Dwelling Typology of Interest: *Flats | pre-2000s*

Retrofit Target:
*Inefficient Heating
Systems*

*EnergyFlex can model
likely energy performance
characteristics such as
heating system efficiency*

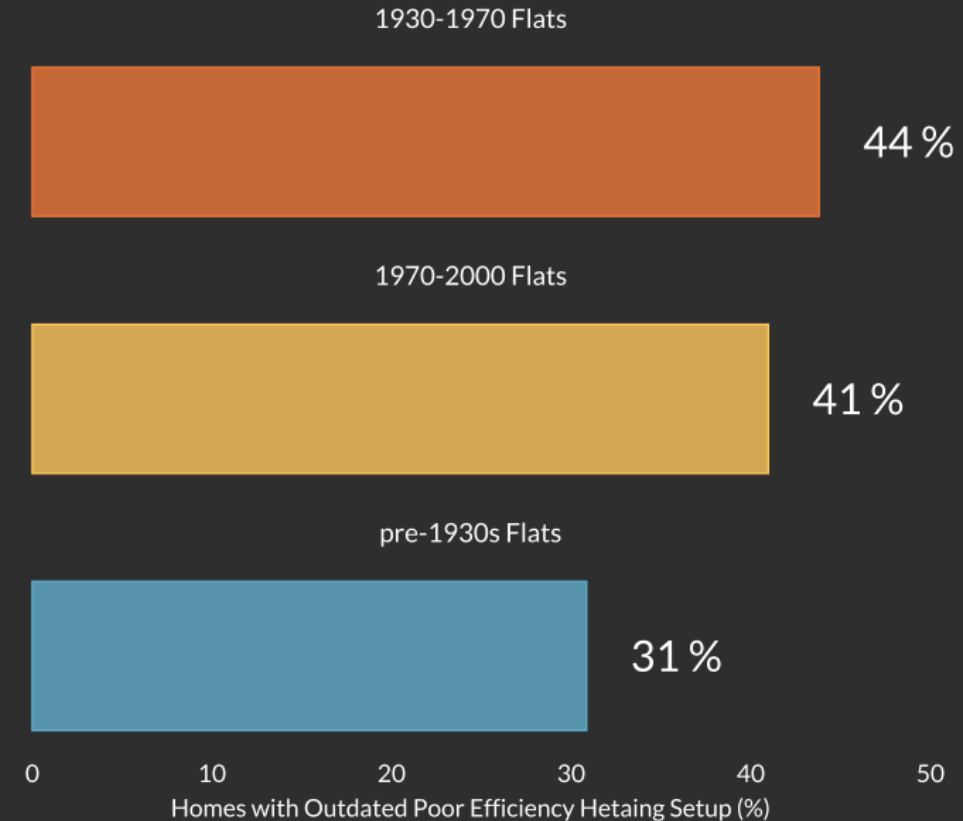

Simulating Retrofit Solutions [DEMO]

Local Authority: Haringey, London

Dwelling Typology of Interest: *Flats* | *pre-2000s*

Using our model we find that older inefficient boilers (SEDBUK 'E' rated or worse) are more prevalent in 1930—2000 Flats.

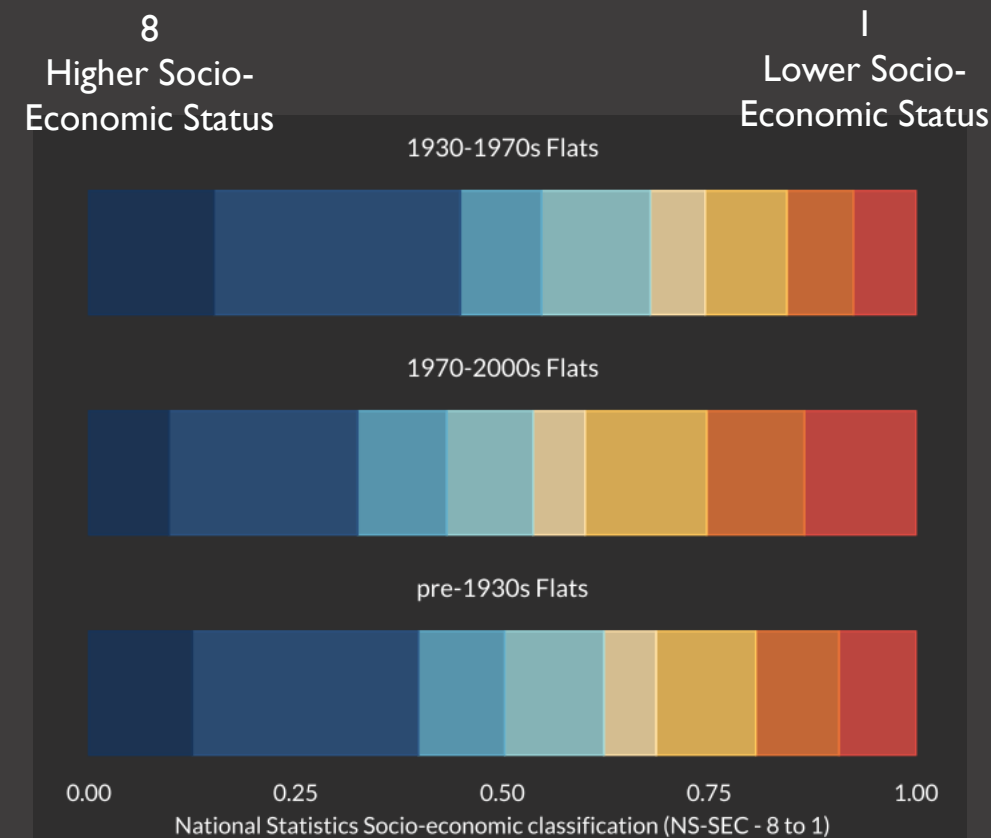

Simulating Retrofit Solutions [DEMO]

Local Authority: Haringey, London

Dwelling Typology of Interest: *Flats* | *pre-2000s*

Our model also gives us socio-economic context on the households living in these different types of housing

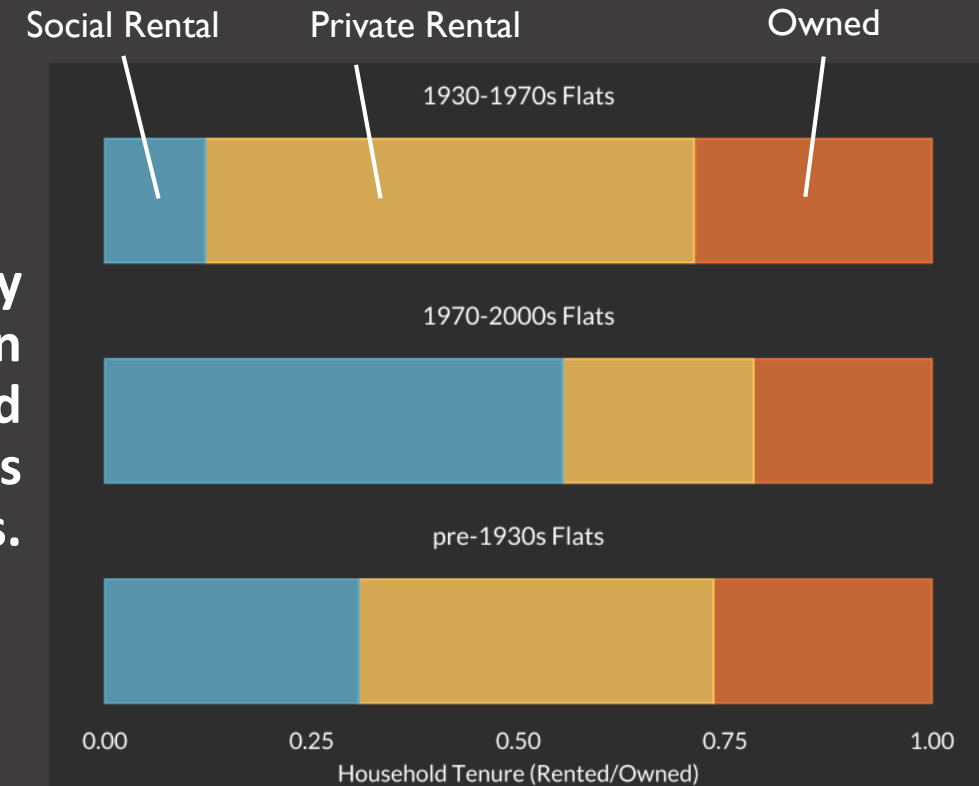

Simulating Retrofit Solutions [DEMO]

Local Authority: Haringey, London

Dwelling Typology of Interest: *Flats* | *pre-2000s*

Knowing who is likely to own households in need of retrofit could help target incentives or policies.

Simulating Retrofit Solutions [DEMO]

Local Authority: Haringey, London

Dwelling Typology of Interest: *Flats* | *pre-2000s*

Solution to consider: *Replace Boilers with Air- Source Heat Pumps*

- *Greater prevalence of inefficient boilers in 1930-2000s Flats.*
- *But households in 1970-2000 Flats more likely to need financial support.*
- *Would need to incentivise private landlords to upgrade heating in 1930-1970s Flats.*

Putting it into practice

- *What sorts of policy questions could we use this for?*
- *How could EnergyFlex be used to locally tailor decarbonisation policies?*
